## 1 Text processing

**Raw:**

- #6124: 1 pack (3/2 oz) of (red, yellow or green) cherry tomatoes
- 1 teaspoon chopped fresh dill or 1/2 teaspoon dried dill

**Filter 1: Wise handling of special characters and numeric conversion.**

- #6124: 1 pack (3/2 oz) of (red, yellow or green) cherry tomato
- 1 teaspoon chopped fresh dill or 1/2 teaspoon dried dill

**Filter 2: Parenthesis handling**

- 1 pack (1.5 oz) of (red, yellow or green) cherry tomato
- 1 teaspoon chopped fresh dill or 0.5 teaspoon dried dill

**Filter 3: Selecting only one word from each list we create (techniques, units, ingredients)**

- 1.5 oz of cherry tomato
- 1 teaspoon chopped fresh dill or 0.5 teaspoon dried dill

**Final:**

- 1.5 oz cherry tomato
- 1 teaspoon chopped dill

## 5 Conclusion:

- Good predictions on nutrients values per gram considering the assumptions
- Recipe generator gives a lot of flexibility
- Creating recipes with precise quantities of total nutrients
- Creating recipes including only low-fat ingredients

**Improvements:**

- Strong assumptions on ingredients' quantities to relax
- Number of ingredients per recipe to be drawn from distribution
- Use ranking of KNN instead of uniform distribution in top 20 neighbours

## 4 Perceptron: Prediction of nutrients

$$\mathcal{L} = \frac{1}{N} \sum_{i=1}^N [\log(\mathbf{w}\mathbf{X}_i) - \log(Y)]^2 + \gamma \sum_{i=1}^N \mathbf{w}_i^2$$

## 2 Dataset Comprehension

Positive skewed normal distribution of ingredients number per recipe. Gives the range of the ingredients to use while creating a new recipe.

Percentage of recipes without X and Y category

Other	0.12						
Fruit	0.11	0.73					
Vegetable	0.044	0.29	0.44				
Sides	0.05	0.37	0.29	0.54			
Meat	0.061	0.43	0.35	0.38	0.64		
Dairy	0.034	0.26	0.12	0.2	0.2	0.34	
Spice	0.024	0.1	0.1	0.11	0.12	0.059	0.16
	Other	Fruit	Vegetable	Sides	Meat	Dairy	Spice

Table expressing the percentage of recipes without the union of the categories.

The following informations can be deduced: 64 % of recipe are vegetarian, 20 % are vegan and 27 % of them contain fruits. The ones that are not desserts in those 27 %, are a potential source of new ingredients association.

## 3 How to choose ingredients to form a recipe?

**Co-occurrence:**  
Relation intensity between ingredients

**K-Nearest Neighbors:**  
Return values of relative distance between ingredients according to co-occurrence matrix. It spots closest ingredients that don't necessarily have direct links or the highest co-occurrence values.
